

Contents

1	Introduction	1
2	Basics	5
2.1	Manufacturing a Solar Cell – Impurity Origin and Reduction	6
2.1.1	Feedstock and Crystallization	6
2.1.2	Defect Redistribution During the Solar Cell Process	12
2.2	Physics of a Solar Cell	17
2.2.1	Mathematical Description of a Solar Cell	18
2.2.2	The I – V Curve and the Fill Factor of a Solar Cell	26
2.2.3	Operating Conditions of a Solar Cell	29
2.3	Loss Mechanisms in Solar Cells	32
2.3.1	Optical Losses	32
2.3.2	Recombination Losses	35
2.4	State-of-the-Art Characterization: Photoluminescence Imag- ing	42
2.4.1	Basic Principle	42
2.4.2	Calibration	47
2.4.3	Generation Conditions	48
3	Efficiency Loss Characterization Methods	51
3.1	ELBA: From Bulk Lifetime to Solar Cell Efficiency	53
3.1.1	Preparation of Lifetime Samples	58
3.1.2	Lifetime Measurements on Wafers	62

3.1.3	Local Cell Simulations	66
3.1.4	Averaging to Global Values	72
3.2	Suns-PLI	84
3.2.1	Approach	86
3.2.2	Theoretical Validation and Analysis of the Suns- PLI Technique – Simulation of Multicrystalline Sil- icon Solar Cells	90
3.2.3	Comparison of Suns-PLI with Suns- V_{oc} Measurements	97
3.2.4	Example: Shunt Detection	101
3.3	FS/BS: Determination of Surface Defects	102
3.3.1	Approach	104
3.3.2	Example: Handling Defects on a Cz Wafer	112
3.4	Summary of Characterization Methods	115
4	Reducing Efficiency Losses by Technological Improvements	119
4.1	Dielectric Rear Side Passivation	120
4.1.1	Cell Results	121
4.1.2	Front and Rear Side Recombination in Dislocations	124
4.2	Impact of Different Diffusion Temperature Profiles and Firing on Iron	129
4.2.1	Approach	131
4.2.2	Results on Intentionally Iron Contaminated mc-Si Wafers	133
4.3	Honeycomb Texture via Nanoimprint Lithography	142
4.3.1	Texturing Process	143
4.3.2	Integration into the Cell Process	146
4.4	Summary of Technological Improvements	159

5	Material Characterization – Feedstock, Crucible, Doping, Wafer Thickness	163
5.1	Feedstock from Siemens and umg Processes	165
5.1.1	Highly Contaminated umg Feedstock	165
5.1.2	Lowly Contaminated umg Feedstock: Solar Cell Processing	170
5.1.3	Lowly Contaminated umg Feedstock: Efficiency Analysis	173
5.2	Efficiency Losses due to the Crystallization Crucible . . .	185
5.2.1	Material and Methods	187
5.2.2	Material Characterization	190
5.3	<i>n</i> -type mc-Si Material	196
5.3.1	Low-Temperature Cell Structure (Silicon Hetero-junctions) – Impact of Lateral Currents on Pseudo Fill Factor	197
5.3.2	High-Temperature Cell Structure – Impact of Boron Diffusion	203
5.4	Wafer Thickness Optimization	215
5.4.1	Approach	217
5.4.2	Results and Discussion	219
5.5	Summary of All Material	226
6	Summary & Outlook	231
	Deutsche Zusammenfassung	239
	Nomenclature	249
	Bibliography	251
	List of Publications	281
