Preface 3

1 Legal and technical rules and standards 9

1.1 Key issues 9

1.2 The railway and its rules and standards 9

1.3 From the technical entity to interoperability 10

1.3.1 Technical unity 11

1.3.2 Legal foundations 12

1.3.3 Interoperability 15

1.4 Cross-border standardisation 18

1.5 Internal railway guidelines 19

1.6 Summary 21

2 Basic principles of the permanent way 23

2.1 Key issues 23

2.2 The railway as a system 23

2.3 Vehicle gauge and structure gauge 23

2.4 Axle loads on the track and their distribution 29

2.4.1 Vertical forces and deflection 30

2.4.2 Lateral forces 32

2.4.3 Longitudinal forces 33

2.5 Classification of lines 36

2.6 The permanent way and its constituent parts 38

2.6.1 The rail 39

2.6.2 Sleepers 50

2.6.3 Track fastenings 59

2.6.4 Track codes 65

2.6.5 Ballast 66

2.6.6 Substructure 73

2.7	Switches and crossings (turnouts).....	76
2.7.1	Basic principles	76
2.7.2	Terminology	78
2.7.3	Main components.....	79
3	Track alignment design	81
3.1	Key issues	81
3.2	Physical principles	81
3.3	Components of a railway route.....	86
3.4	Limits and standard values	88
3.5	Transition curves and cant ramps.....	91
3.5.1	Transition curves and linear cant ramps	93
3.5.2	Transition curves and graduated cant ramps.....	95
3.5.3	Cant deficiency and cant excess.....	100
3.6	Minimum lengths	102
3.7	Reverse curves with an abrupt change in curvature (“Track Scissors”).....	103
3.8	Buffer locking.....	104
3.9	Track re-alignment – variation of the distance between the centres of two tracks	105
3.10	Gradient change	106
3.11	Summary	108
4	Track geometry defects and the determination of correction values	109
4.1	Key issues	109
4.2	Track geometry defects.....	109
4.2.1	Definition and their formation.....	109
4.2.2	Distinction of track geometry defects	110
4.2.3	The Principal Measurement of Track geometry faults in the UK	112
4.2.4	The Phenomenon of Cyclic Top	113
4.2.5	Intervention limits	114
4.2.6	Maintenance methods for correcting track geometry defects	116
4.3	Basic principles of measuring track geometry	117

4.4	Precision method.....	122
4.4.1	Measuring the longitudinal level.....	123
4.4.2	Measuring the alignment.....	136
4.4.3	Systems for measuring longitudinal level and alignment	140
4.5	Compensation method.....	150
4.5.1	4-point method: compensation method without known route parameters	150
4.5.2	3-point method: compensation method with known route parameters.....	151
4.5.3	Electronic compensation method.....	153
4.6	Correcting isolated defects (Spot Tamping).....	154
4.7	Overlifting the track position as a maintenance process	156
4.8	Summary	158
5	The correction of track geometry	159
5.1	Key issues	159
5.2	Basic principles of track geometry maintenance.....	159
5.3	Correction of track geometry with a tamping machine	161
5.3.1	Different types of tamping machines	162
5.3.2	Choice of machine type for the UK.....	164
5.3.3	Work units of a tamping machine.....	165
5.3.4	Preparatory work for a sustainable tamping process	168
5.3.5	Track geometry data input	170
5.3.6	Controlling the tamping process and its parameters.....	174
5.3.7	Spot tamping.....	177
5.3.8	Parallel tamping	177
5.4	Dynamic track stabilisers and consolidators	178
5.5	Ballast distributing and profiling machines	179
5.6	Summary	181
6	Acceptance and quality assurance	183
6.1	Key issues	183
6.2	Acceptance	183
6.2.1	Preliminary acceptance.....	183
6.2.2	Final acceptance.....	184
6.2.3	Quality certification for work performed.....	184

6.2.4	Acceptance limit values in EN 13231-1	185
6.2.5	Acceptance limit values in the UK	185
6.3	Sequence of acceptance	186
6.4	Acceptance of track renewals in the UK	186
6.5	Acceptance criteria for tamping work at DB, ÖBB, SBB and NR	186
	Bibliography.....	203
	Authors.....	215
	List of abbreviations.....	217
	Index	221
